A;Title: Interchain disulfide bonds
A;Note: Cys-16 is involved in a heavy-light chain bond
A;Note: Cys-16 is involved in a heavy-light chain bond
A;Note: Cys-16 is involved in a heavy-light chain bond
C;Comment: This chain was isolated from pooled serum of strain I3 inbred guinea pigs
C;Complex: An immunoglobulin heterortetramer subunit consists of two identical light chain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into c;Superfamily: immunoglobulin C:region; immunoglobulin homology
C;Keywords: duplication; glycoprotein; heterortetramer; immunoglobulin

"Gamma Heavy chain disease in man: cDNA sequence supports partial gene deletion model.";
Proc. Natl. Acad. Sci. U.S.A. 79:3260-3264(1982).

-i- SUBUNIT: DIMER LINKED BY 12 DISULFIDE BONDS; IT HAS AN EXTRA INTERCHAIN DISULFIDE BOND AT POSITION 7 IN ADDITION TO THE 11 NORMALLY PRESENT IN THE HINGE REGION.

-i- MISCELLANEOUS: THE HEAVY CHAIN DISEASE PROTEIN WIS IS SHOWN.

-i- MISCELLANEOUS: THE SEQUENCE OF RESIDUES 42-76 WAS TAKEN FROM THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          REF.2.

REF.2.

RISCELLANEOUS: DISEASE PROTEIN WIS IS LACKING MOST OF THE V REGION.

AND ALL OF THE CHI REGION.

MISCELLANEOUS: DISEASE PROTEIN ZUC LACK MOST OF THE V REGION, ALL OF THE CHI REGION, AND PART OF THE HINGE COMPARED WITH NORMAL GAMMA-3 HEAVY CHAINS.

MISCELLANEOUS: DISEASE PROTEIN OMM MAY REPRESENT AN ALLELIC FORM OR ANOTHER GAMMA CHAIN SUBCLASS.

MISCELLANEOUS: THE HINGE REGION IN GAMMA-3 CHAINS IS ABOUT FOUR MISCELLANEOUS: THE HINGE REGION IN GAMMA-3 CHAINS THREE TIMES AS LONG AS IN OTHER GAMMA CHAINS AND CONTAINS THREE IDENTICAL 15-RESIDUE SEGMENTS PRECEDED BY A SIMILAR 17-RESIDUE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MOST OF THE V REGION

-1- ALTERNATIVE PRODUCTS: CELL LINES PRODUCING IGG CONTAIN TWO MRNA SPECIES FOR IG GAMMA CHAINS. THE MAJOR SPECIES ENCODES SECRETED GAMMA CHAINS. A LESS ABUNDANT SPECIES APPEARS TO ENCODE MEMBRANE-BOUND CHAINS IN THAT IT CONTAINS AN ALTERNATIVE 3' END, ENCODED IN SEPARATE EXONS, THAT IS HOMOLOGOUS WITH THE MEMBRANE-BOUND SEGMENT OF MU CHAINS.

Proc. Natl. Acad. Sci. U.S.A. 79:2623-2627(1982).

-: ALTERNATIVE PRODUCTS: CELL LINES PRODUCING IGG CONTAIN TWO MRNA SPECIES FOR IG GAMMA CHAINS. THE MAJOR SPECIES ENCODES SECRETED GAMMA CHAINS. A LESS ABUNDANT SPECIES APPEARS TO ENCODE MEMBRANE-BOUND CHAINS IN THAT IT CONTAINS AN ALTERNATIVE 3' END, ENCODED IN SEPARATE EXONS, THAT IS HOMOLOGOUS WITH THE MEMBRANE-BOUND SEGMENT OF MU CHAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RT "Cloning and characterization of the gene encoding human representation of the gene encoding human state of the gene encoding human states. J. Biochem. 254:685-691(1998).

CC J. FUNCTION: MAY REGULATE BONE RESORPTION BY BLOCKING TERMINAL STACES OF OSTEOCLAST DIFFERENTIATION AND ALLOWING ACCUMULATION OF NEWLY SYNTHESIZED BONE AND CARFILAGE. MAY INHIBIT IN VITRO CONTENDED TO STEOCLAST DIFFERENTIATION AND ALLOWING ACCUMULATION OF NEWLY SYNTHESIZED BONE AND CARFILAGE. MAY INHIBIT IN VITRO CONTENDED TO STEOCLAST PROGENITORS.

CC OSTEOCLASTOGENESIS BY INTERRUPTING CELL-TO-CCELL SIGNALING BETWEEN CO. -! SUBUNIT: HOMODIMER (MAJOR FORM) AND MONOMER (MINOR FORM) (BY STROMAL CELLS AND OSTEOCLAST PROGENITORS.

CC SIMILARITY!.

CC SIMILARITY: COCATION: EXTRACELLULAR.

CC ISSUBCELLULAR LOCATION: EXTRACELLULAR.

CC SIMILARITY: CONTAINS A LA-NGFR/TOFF TYPE CYSTEINE-RICH REGION.

CC THE PANCREAS OR PERIPHERAL BLOOD LYMPHOCYTES.
